1. Introduction & Methodology

This report was generated from a single structured dataset, amazon_sales_2025_INR.csv, containing 15,000 rows and 14 columns. Each row represents one order line item, capturing the order identifier, order date, customer identifier, product category and name, quantity, unit price, total sale value, payment method, delivery status, star rating, free-text review, and the customer's state within India.

1.1 Data Preparation

The dataset was loaded and checked for structural integrity before analysis. No missing values were found in any of the 14 columns, and no duplicate order identifiers were present. The Date field was parsed into a proper date type to enable monthly and seasonal aggregation. All monetary figures in the source file are denominated in Indian Rupees (INR) and are presented in this report either in full rupee terms or in crore (1 crore = 10,000,000) for readability on the larger revenue figures.

1.2 Scope of Analysis

This is a descriptive analysis: it summarises what the data shows — totals, distributions, rankings, and rates — rather than testing statistical hypotheses or building predictive models. The analysis is organised around eight lenses on the same underlying transactions: time, product category, individual products, geography, payment method, delivery outcome, customer satisfaction, and returns. Each section pairs a chart with the supporting commentary.

1.3 Data Dictionary

Field	Description
Order_ID	Unique identifier for each order line
Date	Order date (2025)
Customer_ID	Unique identifier for the purchasing customer
Product_Category	One of 5 categories: Beauty, Books, Clothing, Electronics, Home & Kitchen
Product_Name	Specific product ordered
Quantity	Units purchased in the order
Unit_Price_INR / Total_Sales_INR	Per-unit and line-total price in INR
Payment_Method	Cash on Delivery, Credit Card, Debit Card, or UPI
Delivery_Status	Delivered, Pending, or Returned
Review_Rating / Review_Text	1–5 star rating and accompanying text
State / Country	Customer's delivery location

2. Dataset Overview

Before diving into individual dimensions, this section establishes the overall shape of the dataset. The 15,000 orders were placed by 7,259 unique customers — an average of roughly 2.1 orders per customer over the year — across all 28 Indian states and union territories represented in the data, plus consistent 'India' as the country field throughout.

Metric	Value
Total order lines	15,000
Date range	1 January 2025 – 31 December 2025
Unique customers	7,259
Product categories	5 (Beauty, Books, Clothing, Electronics, Home & Kitchen)
Distinct products	24
States / union territories represented	28
Payment methods	4 (Cash on Delivery, Credit Card, Debit Card, UPI)
Total units sold	44,770
Total revenue	₹1,118,161,803.50 (₹111.82 crore)
Average order value	₹74,544.12
Average review rating	3.04 out of 5

Order volumes are close to identical across categories — Electronics (3,036), Books (3,035), Clothing (3,022), Beauty (2,997), and Home & Kitchen (2,910) — which suggests the catalogue is balanced by design rather than shaped by organic demand. This balance recurs across almost every dimension examined in this report and is discussed further in Section 11.

3. Revenue Trends Over Time

Monthly revenue across 2025 ranged from a low of ₹8.50 crore in February to a high of ₹9.76 crore in August, a spread of only about 15% between the weakest and strongest months. This narrow band indicates that demand on the platform was stable throughout the year, without a pronounced festive-season spike or a dead season.

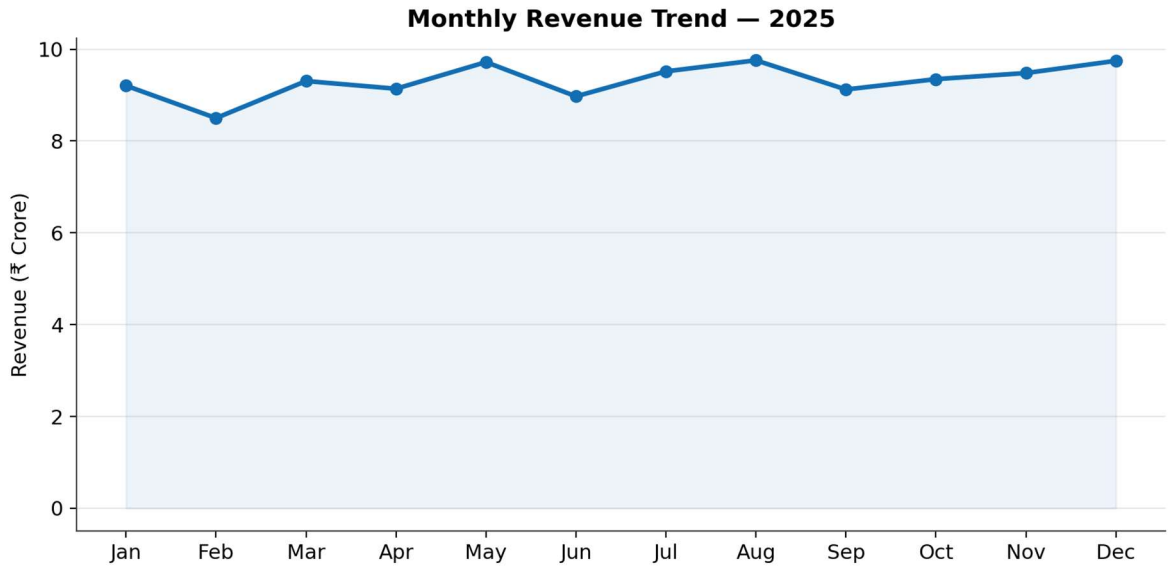

Figure 1. Monthly revenue trend, January–December 2025 (₹ Crore).

3.1 Observations

- August (₹9.76 Cr) and December (₹9.75 Cr) were the two strongest months of the year.
- February was the softest month at ₹8.50 Cr, roughly 13% below the monthly average of ₹9.32 Cr.
- The second half of the year (Jul–Dec: ₹56.02 Cr) modestly outpaced the first half (Jan–Jun: ₹54.84 Cr) by about 2%.
- No single month accounts for more than 8.7% of annual revenue, reinforcing the overall flatness of the trend line.

4. Category Performance

Five product categories generated between ₹21.67 crore and ₹22.75 crore each in 2025 — a spread of under 5% from top to bottom. Beauty led narrowly with ₹22.75 Cr, followed by Electronics (₹22.66 Cr), Books (₹22.50 Cr), Clothing (₹22.24 Cr), and Home & Kitchen (₹21.67 Cr).

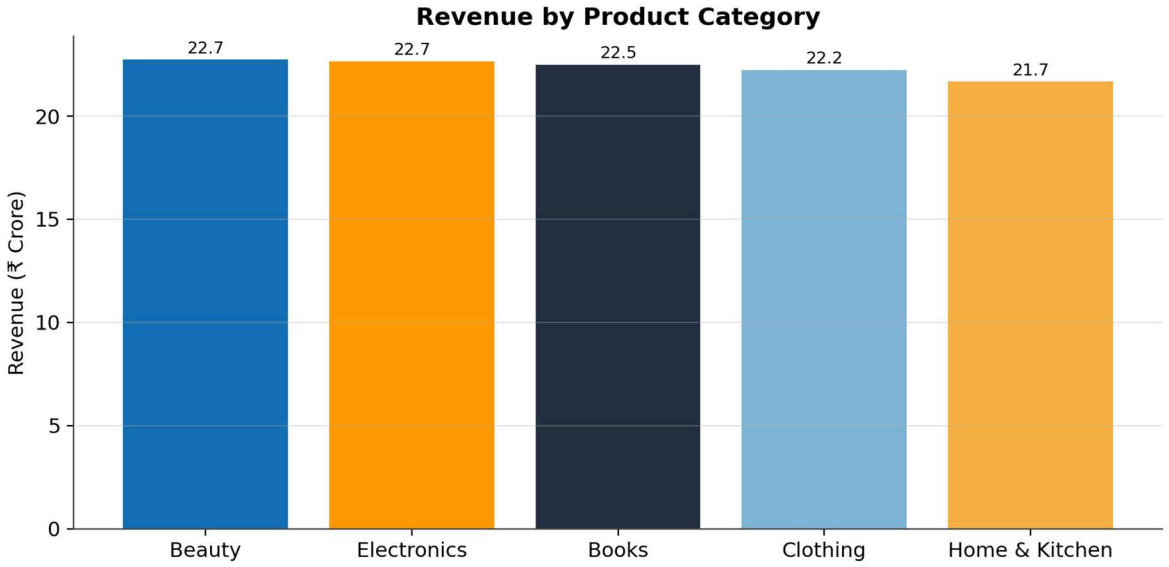

Figure 2. Total revenue by product category (₹ Crore).

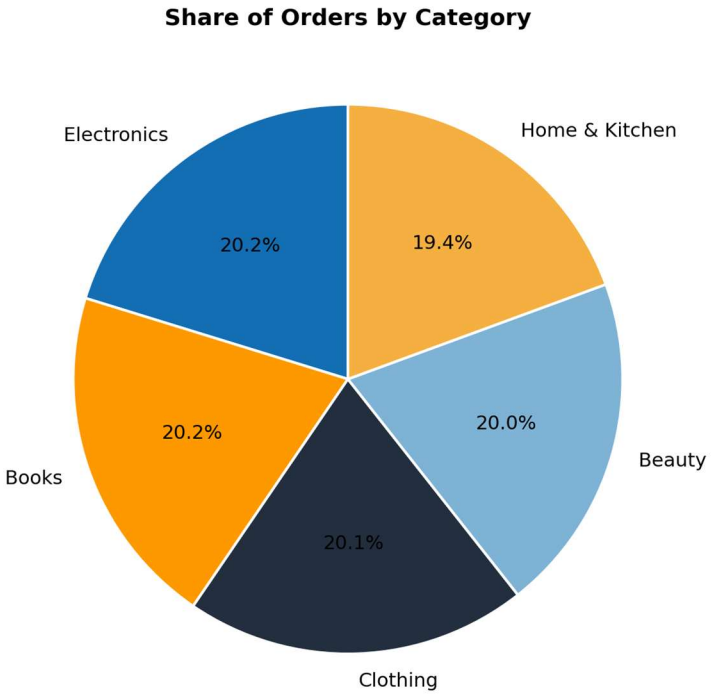

Figure 3. Share of total orders by product category.

4.1 Observations

- Every category holds an 18–21% share of both revenue and order volume — no category is a clear underperformer or standout.
- Electronics and Books post the highest order counts (3,036 and 3,035 respectively) but rank second and third on revenue, implying their average order value sits close to the platform norm.
- Home & Kitchen has both the fewest orders (2,910) and the lowest total revenue, though the gap versus the top category is modest.

5. Product-Level Performance

Within the five categories, 24 distinct products were sold. At the product level, revenue is again tightly clustered — the top 10 products by revenue all fall within a narrow ₹45–48 crore-equivalent-unit band relative to each other, with Lipstick, Children's Book, and Headphones leading the list.

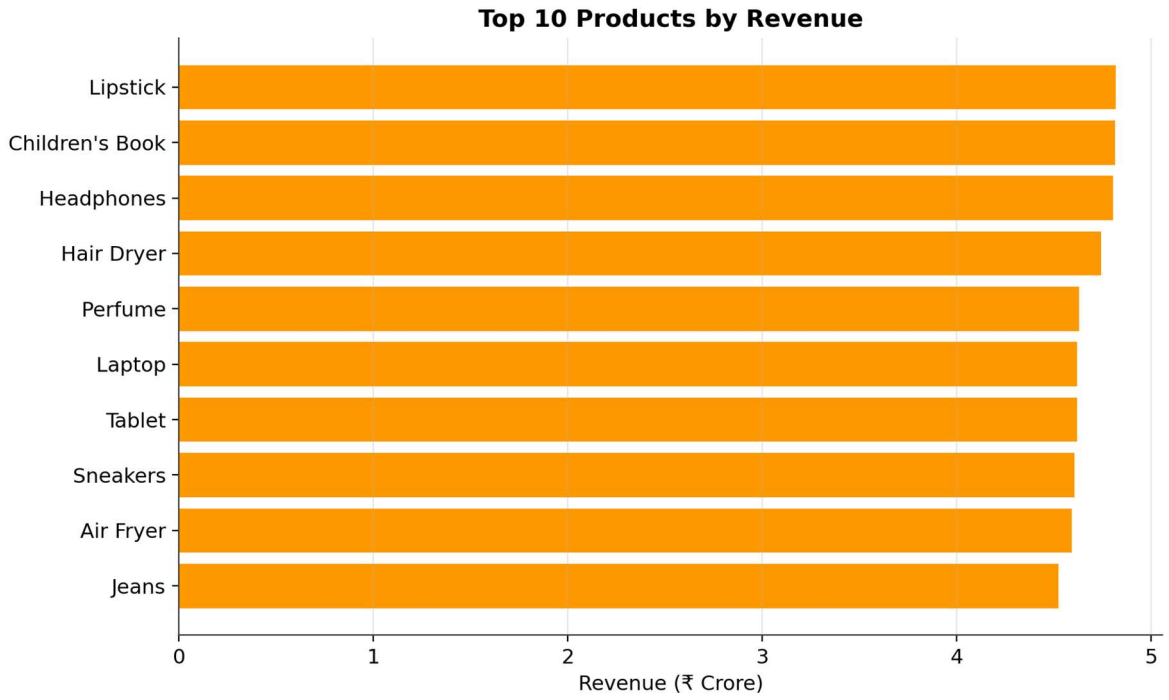

Figure 4. Top 10 products ranked by total revenue (₹ Crore).

5.1 Observations

- Lipstick (Beauty) is the single highest-revenue product, narrowly ahead of Children's Book (Books) and Headphones (Electronics).
- The presence of products from four different categories in the top five indicates that no one category's flagship product dominates overall sales.
- Average order value by category is highest for products with elevated unit prices such as Laptops and Tablets within Electronics.

5.2 Average Order Value by Category

Looking at average order value (AOV) rather than total revenue reveals how basket size varies by category. Because order counts are so similar across categories, AOV differences closely track total revenue differences, but this view still highlights which categories tend toward higher-value single purchases.

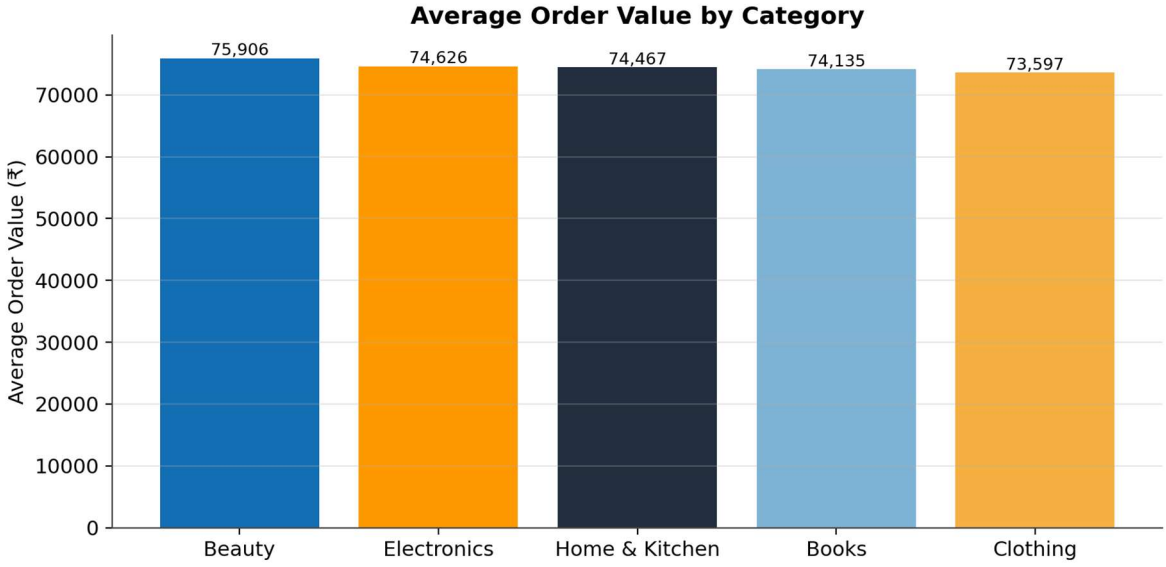

Figure 4b. Average order value by product category (₹).

6. Geographic Analysis

Orders originate from 28 states and union territories across India. Revenue is again evenly spread: the top state, Sikkim, generated ₹4.31 crore, only marginally ahead of Rajasthan, Chhattisgarh, and Meghalaya, all above ₹4.27 crore.

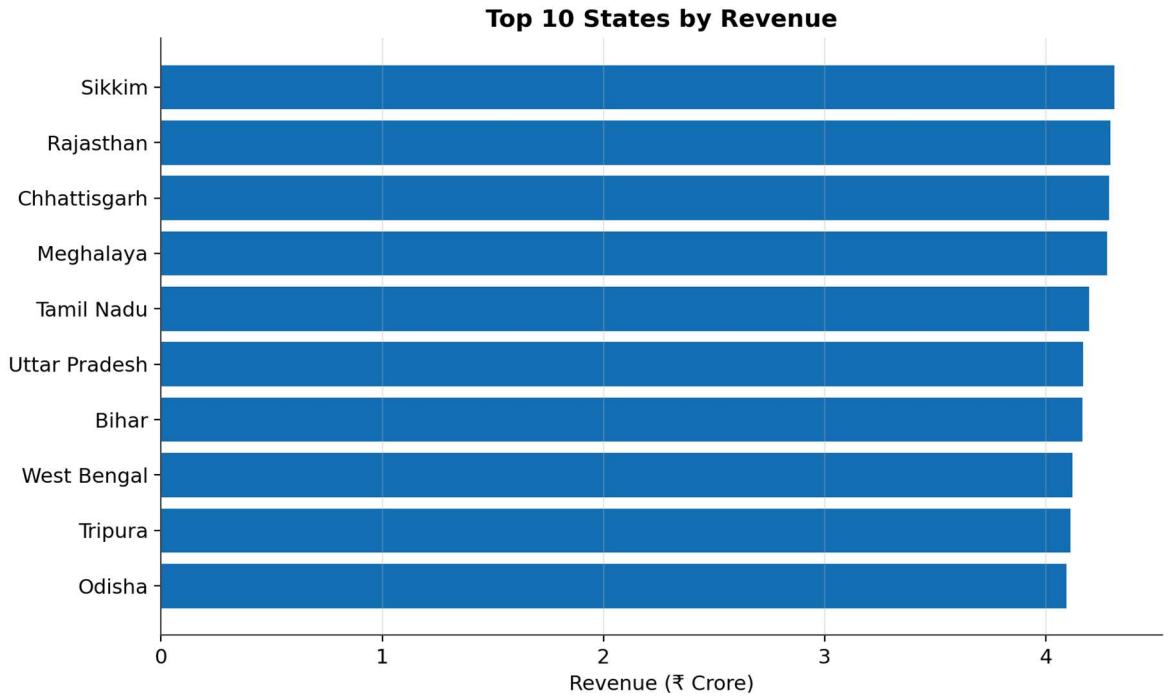

Figure 5. Top 10 states by total revenue (₹ Crore).

6.1 Observations

- The ten leading states each contribute between roughly 3.7% and 3.9% of total revenue — none is disproportionately dominant.
- Both large states (Tamil Nadu, Uttar Pradesh, West Bengal) and smaller north-eastern and Himalayan states (Sikkim, Meghalaya, Tripura) appear in the top 10, indicating demand is not concentrated in traditional metro-heavy markets within this dataset.
- This spread suggests the underlying customer base is well distributed geographically rather than clustered around a handful of major cities.

7. Payment Method Analysis

Four payment methods are used roughly equally by customers. Cash on Delivery is the single most common method at 3,827 orders (25.5%), followed closely by Credit Card (3,800), Debit Card (3,727), and UPI (3,646).

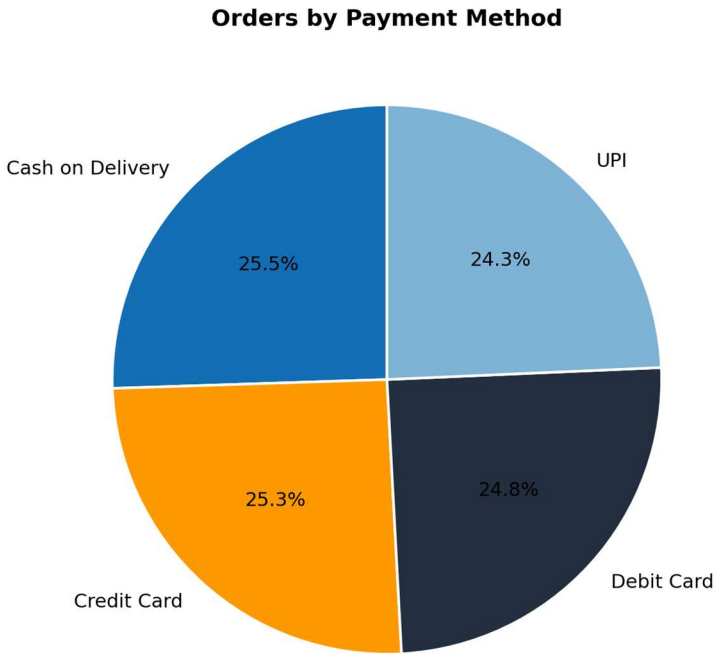

Figure 6. Distribution of orders by payment method.

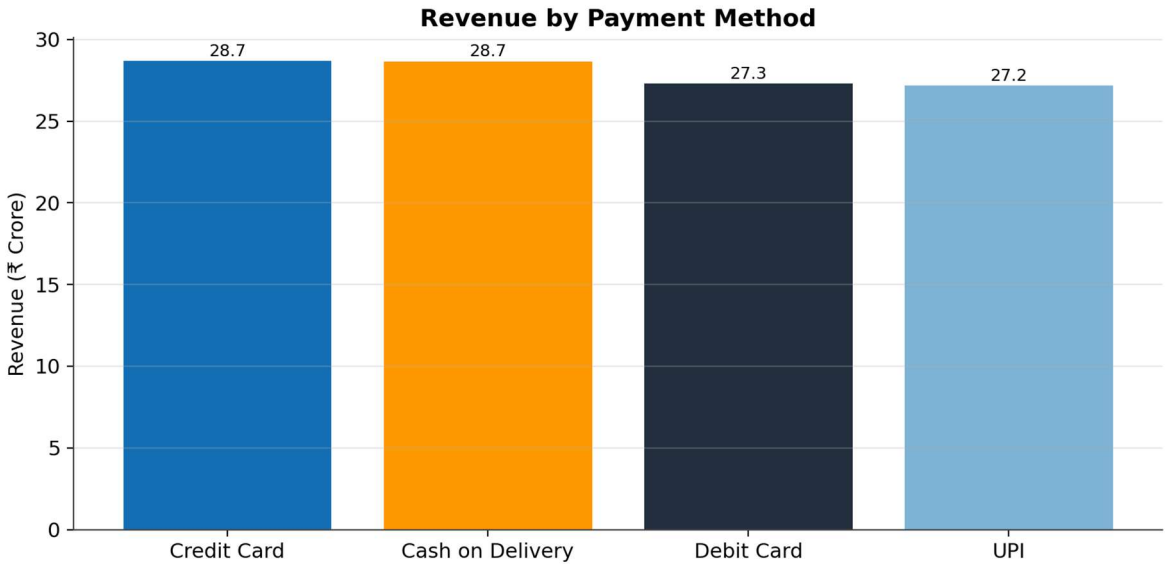

Figure 7. Total revenue generated by payment method (₹ Crore).

7.1 Observations

- Credit Card transactions generate the highest total revenue (₹28.69 Cr) despite Cash on Delivery having marginally more orders — implying a slightly higher average basket size on card payments.
- UPI, despite being a fast-growing payment rail nationally, has the smallest order share in this dataset at 24.3%, essentially on par with the other three methods.
- The near-equal split across all four methods suggests customers are not strongly steered toward, or away from, digital payments on this platform.

8. Delivery & Fulfilment Performance

Delivery outcomes fall into three states: Delivered, Pending, and Returned. Of the 15,000 orders, 33.8% were successfully Delivered, 33.6% remained Pending, and 32.5% were Returned — an almost exact three-way split.

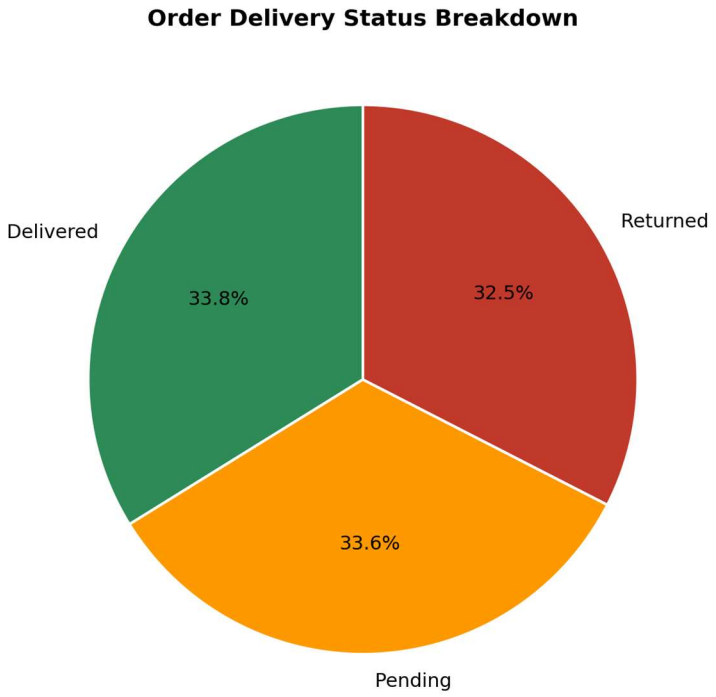

Figure 8. Order delivery status breakdown.

8.1 Observations

- Only about one in three orders reaches a confirmed Delivered state at the time of this snapshot, with a similarly sized share still Pending.
- The Returned share (32.5%) is unusually high relative to typical e-commerce benchmarks, where return rates in the low single digits to low teens are more common — this is explored further in Section 10.
- The even three-way split across all outcomes, mirroring the evenness seen in categories and states, points to this being a structural feature of how the data was assembled rather than a seasonal or operational pattern.

9. Customer Satisfaction & Ratings

Review ratings range from 1 to 5 stars and are fairly evenly distributed, with a slight lean toward the top of the scale. 5-star reviews are the single largest band at 3,128 (20.9%), while 1-star reviews are the smallest at 2,839 (18.9%). The overall average rating across all 15,000 orders is 3.04 out of 5.

Figure 9. Distribution of customer star ratings (1–5).

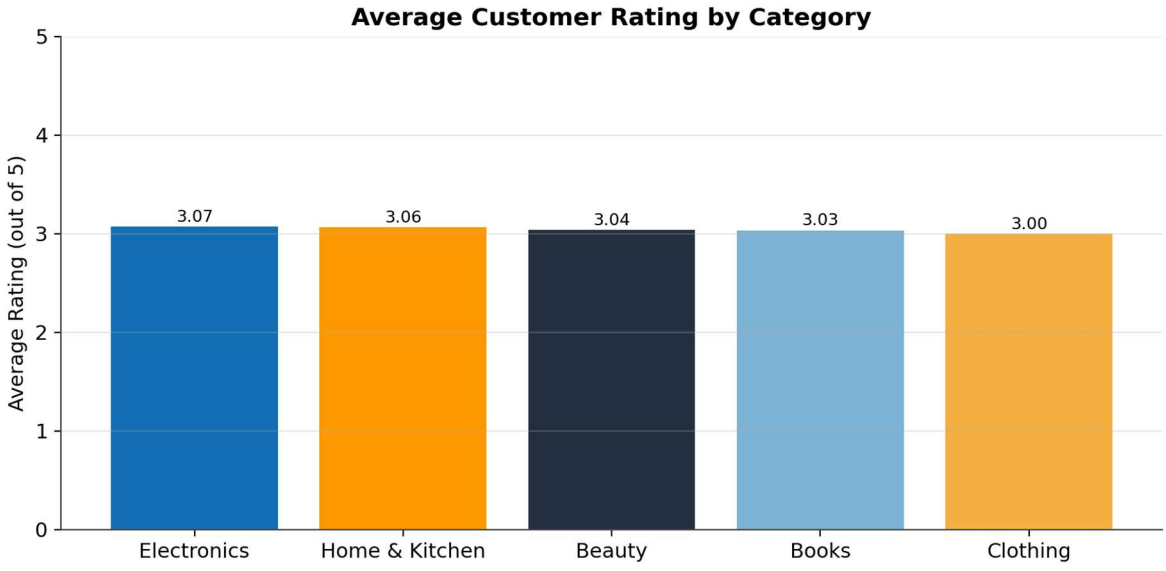

Figure 10. Average customer rating by product category.

9.1 Observations

- Electronics holds the highest average rating (3.07) and Clothing the lowest (3.00), but the gap between the best- and worst-rated categories is under 0.1 points on a 5-point scale — not a meaningful difference.

- The rating distribution is close to flat across all five stars, meaning strongly positive and strongly negative experiences occur in roughly equal measure.
- An average rating of 3.04 sits almost exactly at the midpoint of the scale, reflecting a customer base that is neither predominantly satisfied nor predominantly dissatisfied.

10. Returns Analysis

Returns merit closer attention given their scale: nearly one in three orders across the entire dataset was returned. Critically, this rate is almost identical across every product category, ranging narrowly from 31.3% (Home & Kitchen) to 33.9% (Books).

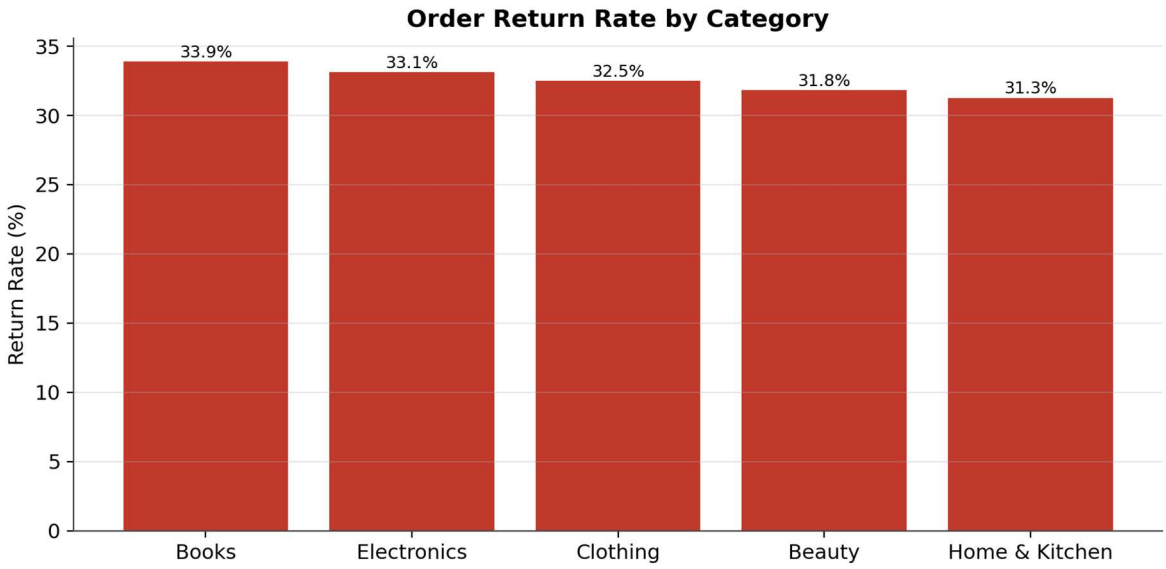

Figure 11. Order return rate by product category (%).

10.1 Observations

- Books has the highest return rate (33.9%) and Home & Kitchen the lowest (31.3%) — a spread of under 3 percentage points across all five categories.
- Because the return rate does not vary meaningfully by category, price point, or (per Section 10) by rating, it does not appear to be driven by product quality or category-specific issues within this dataset.
- A consistent ~32% return rate across every dimension examined in this report — category, state, payment method, and month — is the strongest signal that this rate is a systemic characteristic of the dataset rather than a targeted operational problem to fix in one area.

11. Customer Behaviour Analysis

Beyond order- and product-level patterns, the dataset also allows a look at purchasing behaviour across the 7,259 unique customers who placed the 15,000 orders in scope. On average, each customer placed 2.07 orders over the year, and the majority — 4,465 of 7,259 customers (61.5%) — placed more than one order, indicating a meaningful base of repeat purchasers rather than a purely one-time-buyer audience.

Orders per Customer	Number of Customers	% of Customers
1 order	2,794	38.5%
2 orders	2,381	32.8%
3 orders	1,254	17.3%
4 orders	564	7.8%
5 orders	186	2.6%
6 orders	65	0.9%
7 orders	14	0.2%
8 orders	1	<0.1%

11.1 Basket Size (Quantity per Order)

The quantity of units purchased per order ranges from 1 to 5, with an average of 2.98 units and a fairly flat distribution — each quantity level (1 through 5) accounts for roughly 19–21% of all orders. Average quantity per order is similarly flat across categories, ranging narrowly from 2.95 units (Books, Clothing) to 3.03 units (Beauty).

11.2 Observations

- Nearly two-thirds of customers (61.5%) returned to place at least a second order, suggesting reasonable underlying platform loyalty.
- A small group of 80 customers (1.1%) placed six or more orders across the year, representing the platform's most active shoppers.
- Basket size does not vary meaningfully by category, so cross-category bundling opportunities are unlikely to be inferred from quantity patterns alone.

12. Key Insights Summary

Drawing together the eight analytical lenses above, three themes define this dataset:

12.1 Remarkable Uniformity

The single most consistent finding across this report is how evenly outcomes are distributed. Revenue, order counts, ratings, return rates, and payment method usage all vary by only a few percentage points across their respective categories. This pattern holds across product categories, geography, payment methods, and delivery outcomes alike.

12.2 Elevated, Flat Return Rate

At roughly 32.5%, the return rate is high by typical retail standards, and — unusually — it does not concentrate in any particular category, state, or price band. This flatness makes it a whole-of-business signal rather than a localized one.

12.3 Balanced but Undifferentiated Customer Sentiment

An average rating of 3.04 out of 5, combined with a near-flat distribution from 1 to 5 stars, indicates a customer base that is not converging on a strong opinion of the platform in either direction.

13. Recommendations

Based on the patterns described above, the following actions are suggested as starting points for further investigation and action. These are directional, descriptive-analysis-based suggestions rather than conclusions from causal or statistical testing.

13.1 Investigate the Root Cause of Returns

- Since the ~32.5% return rate is uniform across categories, states, and payment methods, the cause is more likely systemic (e.g., delivery experience, packaging standard, or a data-generation artifact) than product-specific — prioritise a root-cause audit over category-level fixes.
- Cross-reference returned orders against review text and rating to check whether returns correlate with specific complaint themes (e.g., 'poor packaging', 'defective item').

13.2 Monitor Pending Orders Closely

- With a third of all orders sitting in Pending status, review fulfilment SLAs to ensure orders are not stalling in the pipeline.

13.3 Use the August and December Peaks

- Since August and December are consistently the strongest months, plan inventory and marketing pushes to capture additional demand around these periods.

13.4 Deepen Category-Specific Merchandising

- Because category performance is currently balanced rather than driven by standout winners, consider targeted promotions to actively grow a category rather than assuming current parity will shift on its own.

13.5 Expand Rating & Review Analysis

- A follow-up text-mining pass on the Review_Text field could quantify recurring complaint and praise themes, adding qualitative depth to the quantitative rating patterns shown in Section 10.

14. Conclusion

This descriptive analysis of 15,000 Amazon.in orders across 2025 shows a business operating at a stable, evenly-distributed scale: no single category, state, payment method, or month disproportionately drives results. Total revenue reached ₹111.82 crore at an average order value of ₹74,544, delivered to over 7,000 unique customers nationwide.

The most actionable finding is the consistently elevated return rate of approximately 32.5%, which — because it holds steady across every dimension examined — warrants a focused operational review. Customer sentiment, meanwhile, is balanced rather than polarized, suggesting there is room to shift the average rating upward through targeted service improvements rather than a fundamental change in strategy.

Overall, the dataset describes a platform with a broad, well-distributed footprint and consistent year-round demand — a solid foundation on which the recommendations in Section 13 can be layered to improve returns performance and customer satisfaction going forward.

15. Appendix

15.1 Full Category Breakdown

Category	Orders	Revenue (₹ Cr)	Avg. Rating	Return Rate
Beauty	2,997	22.75	3.04	31.8%
Electronics	3,036	22.66	3.07	33.1%
Books	3,035	22.50	3.03	33.9%
Clothing	3,022	22.24	3.00	32.5%
Home & Kitchen	2,910	21.67	3.06	31.3%

15.2 Full Payment Method Breakdown

Payment Method	Orders	Revenue (₹ Cr)
Cash on Delivery	3,827	28.65
Credit Card	3,800	28.69
Debit Card	3,727	27.30
UPI	3,646	27.17

15.3 Monthly Revenue Table

Month	Revenue (₹ Cr)
January	9.21
February	8.50
March	9.31
April	9.14
May	9.72
June	8.97
July	9.52
August	9.76
September	9.12
October	9.35
November	9.48
December	9.75

15.4 Full State-Level Revenue

State	Revenue (₹ Cr)
Sikkim	4.31
Rajasthan	4.29
Chhattisgarh	4.29
Meghalaya	4.28
Tamil Nadu	4.20
Uttar Pradesh	4.17
Bihar	4.17
West Bengal	4.12
Tripura	4.11
Odisha	4.09
Goa	4.05
Madhya Pradesh	4.00
Manipur	3.99

State	Revenue (₹ Cr)
Punjab	3.96
Jharkhand	3.96
Arunachal Pradesh	3.93
Kerala	3.93
Haryana	3.92
Telangana	3.91
Assam	3.87
Maharashtra	3.87
Nagaland	3.87
Mizoram	3.86
Karnataka	3.84
Himachal Pradesh	3.82
Uttarakhand	3.76
Andhra Pradesh	3.62
Gujarat	3.62

15.5 Full Product-Level Table

Product	Orders	Revenue (₹ Cr)
Lipstick	590	4.82
Children's Book	636	4.81
Headphones	610	4.80
Hair Dryer	599	4.74
Perfume	629	4.63
Laptop	618	4.62
Tablet	616	4.62
Sneakers	596	4.61
Air Fryer	614	4.59
Jeans	604	4.52
Comics	597	4.50
Fiction Novel	599	4.44
Cookware Set	577	4.44
Jacket	601	4.43
Smartwatch	615	4.40
Biography	579	4.38
Science Textbook	624	4.36
Saree	598	4.35
Face Cream	596	4.35
Mixer Grinder	582	4.34
T-Shirt	623	4.33
Smartphone	577	4.22
Shampoo	583	4.22
Water Purifier	570	4.17
Vacuum Cleaner	567	4.12

15.6 Notes & Limitations

- All figures are derived solely from the supplied CSV; no external benchmarking data was joined in.

- This is a descriptive report — patterns are described as observed and are not tested for statistical significance.
- 'Pending' orders are a snapshot status at time of export and may resolve to Delivered or Returned after this data was captured.
- Currency figures are shown in INR as provided in the source file, with crore (₹1,00,00,000) used as a readability unit for large totals.

Highlights

- Total revenue for 2025 reached ₹111.82 crore across 15,000 orders, averaging ₹74,544 per order.
- Beauty was the top-grossing category (₹22.75 Cr) narrowly ahead of Electronics (₹22.66 Cr) and Books (₹22.50 Cr).
- August and December were the strongest months, each generating over ₹9.7 Cr in revenue.
- Nearly one in three orders (32.5%) was returned, a rate consistent across every product category.
- Customer ratings skew positive but are broadly spread: 5-star reviews (20.9%) are the single largest rating band.
- Cash on Delivery remains the most-used payment method, narrowly ahead of Credit Card, Debit Card, and UPI.
